

Anglais

Hello,

I would like a professional website for a client in the home care sector. The website will include a showcase section presenting the company (services, values, team, contact, etc.) and two secure areas: a **family** section, where clients can view their invoices, intervention schedule, and communicate through a messaging system, as well as an **employee** section, where staff can access their schedules, pay slips, internal documents, online training, and messaging. The website must be responsive, secure, optimized for SEO, and easily manageable by the client.

I have already secured hosting with Infomaniak, including the domain name, so you can work directly on it for simplicity if you wish.

I will provide the content for the pages, as well as the photos (you'll need to put some in initially, and I will send the rest later).

Here are the instructions for this project:

SITE

- **Who we are**
- **Our values, What sets us apart**
- **Our services** (one page per service)
- **A section for a blog** (linked in the header as well)
- **Contact** (form + practical information)

CLIENT AREA

Accessible via secure login, reserved for service beneficiaries

- Access to **personal information and contracts**
- View and download **invoices**

- **Intervention schedule**
- Any personalized administrative documents

EMPLOYEE AREA

Secure access reserved for employees

1. **Complete profile sheet:** personal information, job position, contract
2. **Online work schedule** (modifiable on the admin side)
3. **Intervention tracking** (history, frequency)
4. Download:
 - **Pay slips**
 - **Follow-up sheets**
 - **Activity reports**
5. **Access to online training** (documents, videos, tracking)
6. **Internal messaging system** for communication with client managers

ADMIN AREA

- Manage user accounts (clients/employees)
- Update schedules
- Upload or modify documents
- Add news or blog content

The website will be connected to the mobile app for tracking interventions.
